

# PRESCHOOL

Life Science: Living things have characteristics and basic needs

- Discover the basic needs of an animal at the ELC! Look around you and find some stuff that they might need to survive.

Earth Science: Earth's materials have properties and characteristics that affect how we use those materials.

## **Activity #1: Exploring Basic Needs- "The Life Box"**

**Objective:** This activity is designed to help learn about four essential factors necessary for life.

**Supplies:** box of some kind, soil, bottle of water, potted plant (optional)

### **Procedure:**

- Start with a little walk outside and ask your child what they need to feel good and happy. Try to get them to understand that they *need* food and water.
- Next, talk about what plants need to grow-- soil, water, and sunlight!
- Now it's time to build your box of life--
  - Grab your shoebox and put soil and a bottle of water inside.
  - Have your child open up the box and ask him/her what they see inside.. Tell them there are actually FOUR things in the box!
  - At this point he/she will probably be confused--- have them think about what else is *in* the box ( AIR and SUNLIGHT).
    - To help them, try putting a lid on the box and ask them what's different inside now.

### **Wrap-Up/Extension:**

- Go purchase a potted plant and see if your child can remember what will help make that plant stay alive and grow!
